Positive Airway Pressure therapy is recommended to:

- Reduce air trapping
- Help with mucociliary clearance
- Prevent or reverse atelectasis
- Improve delivery of inhaled medications

The VersaPAP™ device amplifies the supplied air (or oxygen) by 4 times, helping increase the amount of air being inhaled and decreasing the work of breathing. It can also help reduce noise and be combined with prescribed oxygen therapy.

The goal of therapy is generally to improve airway clearance, increase gas exchange, and improve lung volumes.
4. As the patient exhales through the device, verify that the manometer gauge is at the desired pressure range.

5. Have the patient inhale and exhale for the prescribed amount of time.

See product insert for full instructions and additional information.
